In the Claims:

Please cancel claims 1-4, 7-16, 18 and 35 as shown in the following listing of pending claims.

1-24. (Cancelled)

25. (Previously Presented) A disk drive comprising:

a rotatable disk;

an actuator that supports a transducer;

a voice control motor (VCM) including a coil winding configured to receive a signal to move the

actuator so that the transducer is moved relative to the disk;

a spindle motor having a plurality of windings and a rotor rotatable at an operating spin-rate during

an operation mode of the disk drive;

a spindle motor driver connected to apply winding currents across a combination of the spindle motor

windings, and to receive a speed signal to enable measurement of spindle motor speed; and

a processor coupled to the VCM to apply a signal to measure a resistance of the VCM coil winding

and provide a temperature estimate based on the measured resistance, the processor further coupled to

receive the speed signal enabling measurement of the spindle motor speed, the processor providing a signal

to the spindle motor driver to turn off the spindle motor if the spindle motor speed has not reached the

operating spin-rate after a period of time, wherein the period of time is increased with a decrease in the

temperature estimate provided from the processor; and

a spindle motor controller coupling the processor to the spindle motor driver, wherein the spindle

motor driver applies the winding currents to generate torque on the rotor to cause movement of the spindle

motor, and wherein the spindle motor controller provides a signal to control a magnitude of the winding

-2-

currents applied to increase the torque during startup corresponding to the decrease in the temperature

estimate provided from the processor.

26. (Previously Presented) A disk drive comprising:

a rotatable disk;

an actuator that supports a transducer;

a voice control motor (VCM) including a coil winding configured to receive a signal to move the

actuator so that the transducer is moved relative to the disk;

a spindle motor having a plurality of windings and a rotor rotatable at an operating spin-rate during

an operation mode of the disk drive;

a spindle motor driver connected to apply winding currents across a combination of the spindle motor

windings, and to receive a speed signal to enable measurement of spindle motor speed; and

a processor coupled to the VCM to apply a signal to measure a resistance of the VCM coil winding

and provide a temperature estimate based on the measured resistance, the processor further coupled to

receive the speed signal enabling measurement of the spindle motor speed, the processor providing a signal

to the spindle motor driver to turn off the spindle motor if the spindle motor speed has not reached the

operating spin-rate after a period of time, wherein the period of time is increased with a decrease in the

temperature estimate provided from the processor; and

a spindle motor controller coupling the processor to the spindle motor driver, the spindle motor

controller configured to identify a sequence of commutation states and send commutation voltage control

signals to the spindle motor driver to apply voltages across a selected combination of the windings of the

spindle motor to cause the sequence of commutation states resulting in torque on the rotor to cause a desired

movement of the spindle motor, wherein the spindle motor controller further provides a series of commutation

- 3 -

clock pulses to advance the spindle motor driver between commutation states, and wherein the spindle motor

controller controls timing of the commutation clock pulses to increase the torque applied during startup

corresponding to the decrease in the temperature estimate provided by the processor.

27. (Previously presented) The disk drive of claim 25, wherein the spindle motor controller is configured to

identify a sequence of commutation states and send commutation voltage control signals to the spindle motor

driver to apply voltages across a selected combination of the windings of the spindle motor to cause the

sequence of commutation states resulting in torque on the rotor to cause a desired movement of the spindle

motor, wherein the spindle motor controller further provides a series of commutation clock pulses to advance

the spindle motor driver between commutation states, and wherein the spindle motor controller controls timing

of the commutation clock pulses to increase the torque applied during startup corresponding to the decrease

in the temperature estimate provided by the processor.

28. (Previously Presented) The disk drive of claim 25, wherein the signal applied to measure the resistance

of the VCM coil winding is a set voltage, and the resistance is determined from the resulting current received

from the VCM coil winding.

29. (Previously Presented) The disk drive of claim 25, wherein the signal applied to measure the resistance

of the VCM coil winding is a set current, and the resistance is determined from the resulting voltage across

the VCM coil winding.

30. (Previously Presented) The disk drive of claim 25, further comprising a memory connected with the

processor, wherein processor readable code is stored in the memory the code being readable to cause the

-4-

processor to apply the signal to measure the resistance of the VCM coil winding during startup, and to

determine the temperature from a table of values stored in the memory with temperature corresponding to

measured resistance.

31. (Previously Presented) The disk drive of claim 25, further comprising a memory connected with the

processor, wherein processor readable code is stored in the memory the code being readable to the processor

to apply the signal to measure the resistance of the VCM coil winding during startup, and to determine the

temperature based on a calculation using the measured resistance.

32. (Previously Presented) A disk drive comprising:

a rotatable disk;

a transducer;

an actuator that supports the transducer;

a voice control motor (VCM) connected to the actuator, the VCM including a coil winding configured

to receive a signal to move the actuator so that the transducer is moved relative to the disk;

a processor coupled to the VCM to apply a signal to measure a resistance of the VCM coil winding,

and to provide a temperature estimate based on the measured resistance;

a spindle motor having a plurality of windings and a rotor rotatable at an operating spin-rate during

an operation mode of the disk drive;

a spindle motor driver connected to apply winding currents across a combination of the spindle motor

windings; and

a spindle motor controller coupling the processor to the spindle motor driver, wherein the spindle

motor driver applies the winding currents to generate torque on the rotor to cause movement of the spindle

- 5 -

motor, and wherein the spindle motor controller provides a signal to control a magnitude of the winding

voltages applied to increase the torque applied during startup corresponding to a decrease in the temperature

estimate provided from the processor.

33. (Previously Presented) The disk drive of claim 32, wherein the spindle motor controller is configured to

identify a sequence of commutation states and send a signal to the spindle motor driver to apply voltages

across a selected combination of the windings of the spindle motor to cause the sequence of commutation

states resulting in torque on the rotor to cause a desired movement of the spindle motor, wherein the spindle

motor controller further provides a series of commutation clock pulses to advance the spindle motor driver

between commutation states, and wherein the spindle motor controller controls timing of the commutation

clock pulses to increase the torque applied during startup corresponding to the decrease in the temperature

estimate provided by the processor.

34. (Original) A disk drive comprising:

a rotatable disk;

a transducer;

an actuator that supports the transducer;

a voice control motor (VCM) connected to the actuator, the VCM including a coil winding configured

to receive a signal to move the actuator so that the transducer is moved relative to the disk;

a processor coupled to the VCM to apply a signal to measure a resistance of the VCM coil winding,

and to provide a temperature estimate based on the measured resistance;

a spindle motor having a plurality of windings and a rotor rotatable at an operating spin-rate during

an operation mode of the disk drive;

- 6 -

a spindle motor driver connected to apply winding voltages across a combination of the spindle motor

windings; and

a spindle motor controller coupling the processor to the spindle motor driver, the spindle motor

controller configured to identify a sequence of commutation states and send a signal to the spindle motor

driver to apply voltages across a selected combination of the windings of the spindle motor to cause the

sequence of commutation states resulting in torque on the rotor to cause a desired movement of the spindle

motor, wherein the spindle motor controller further provides a series of commutation clock pulses to advance

the spindle motor driver between commutation states, and wherein the spindle motor controller controls timing

of the commutation clock pulses to increase the torque applied during startup corresponding to a decrease in

the temperature estimate provided by the processor.

35. (Cancelled)
